

1. INTRODUCTION

1.1 About the project

The "Contact Management System" has been developed to override the problems prevailing in the practicing manual system. This software is supported to eliminate and, in some cases, reduce the hardship faced by the existing system. The program is reduced as much as possible to avoid errors while entering the data. It also provides error messages while entering invalid data. No prior knowledge is required for the user to use this system. Thus, by this all it proves it is user-friendly. Contact Management System can lead to error free, secure, and reliable management system.

1.2 Overview of the project

The main aim of the Project on Contact Management System is to manage the details of contact, and to make it easy for the user to access the data. The purpose of the project is to automate the existing manual system by the help of computerized equipment and full-fledged computer software, fulfilling their requirements, so that their valuable data/information can be stored for a longer period with easy accessing and manipulation of the same. The project is built at an administrative end and thus only the administrator is guaranteed the access. It is a project designed to organize all the given data of the added contacts into easily accessible format.

1.3 Objective of the project

The main objective of this project is to:

- Manage **Contact Information** Efficiently.
- Provides **searching of contacts** based on factors such as name or phone number.
- Provide an easy method to **Add and delete contacts**.
- **Editing and updating** of records is improved which results in proper resource management of contact data.
- **Safely access and manage** the data of contacts.

2. SYSTEM SPECIFICATION

2.1 Development Environment

2.1.1 Hardware Configuration

PROCESSOR	: Intel Core i7-5960X
RAM	: Hyper X Predator 3600 2X8GB
GRAPHICS ADAPTER	: Nvidia GeForce GTX Titan Xp
MONITOR	: AOC Agon AG352UCG
KEYBOARD	: Logitech G910 Orion Spectrum
MOUSE	: Logitech G903

2.1.2 Software configuration

OPERTATING SYSTEM	: Windows 10
EDITOR	: IDLE
PROGRAMMING LANGUAGE	: Python
FEATURES USED	: Function
DATABASE	: My SQL
CONNECTIVITY	: Python MySQL Connector

2.2 Features of software used

Python programming language was developed by Guido Van Rossum in 1990's. Python is based on two programming languages ABC language and modular 3. Python is an interpreted language.

Interpreter is a language processor which converts a high-level language into machine language by converting and executing line by line. If there is an error in any line, the execution will resume only if the error is rectified.

Advantages of python

- Easy to use object oriented language.
- Expressive language.
- Interpreted language.
- A complete language.
- Cross platform language.
- Free and open source.
- Variety of usage and applications.

Working with python

We can work with python in two different ways:

- **Interactive mode**
- **Script mode**

Interactive mode

Here we type one command at a time and python executes the given command and gives the output. We type the command in front of the Command Prompt(>>>). We cannot save the command in the form of a program. The output is displayed in between the command lines.

Script mode

In the mode we can save all the command in the form of a program file. We can see all output lines together.

Steps for writing and executing a program

- Open an editor of your choice.
- Start new file (file→new) and type the program in it.
- Save the program file with extension .py
- Run the program by clicking run→run command (F5).

Python is an object oriented programming language. The object oriented programming approach is based on the concepts data abstraction, data hiding, data encapsulation, inheritance and polymorphism. Object oriented programming is supported by the concepts class, modules and libraries.

A class is a template representing a group of objects that share common properties and relationships. A library refers to a collection of modules that together cater the specific type of means or applications. A module is a file (.py files) containing variables, class definitions, statements and functions related to a particular task.

MYSQL (RDBMS)

Mysql is a freely available open source Relational Database Management System that uses structured query language (SQL). Mysql support a secure environment for storing maintaining and accessing language. Mysql database system refers to the combination of a mysql server instance and a mysql database. Mysql operator using client/server architecture in which the server runs on the machine containing the database and clients connects to the server over a network.

To access data within the Mysql database all programs and users must use structured query language. It is a language that enables to create and operate on relational database which are sets of related information stored in tables. SQL provides different type of command like Data Definition Language commands (DDL), Data Manipulation Language commands (DML) and Transaction Control Language (TCL).

Mysql and python are connected using certain libraries. Mysql connector, library helps to connect python with Mysql database.

3. SYSTEM DESIGN

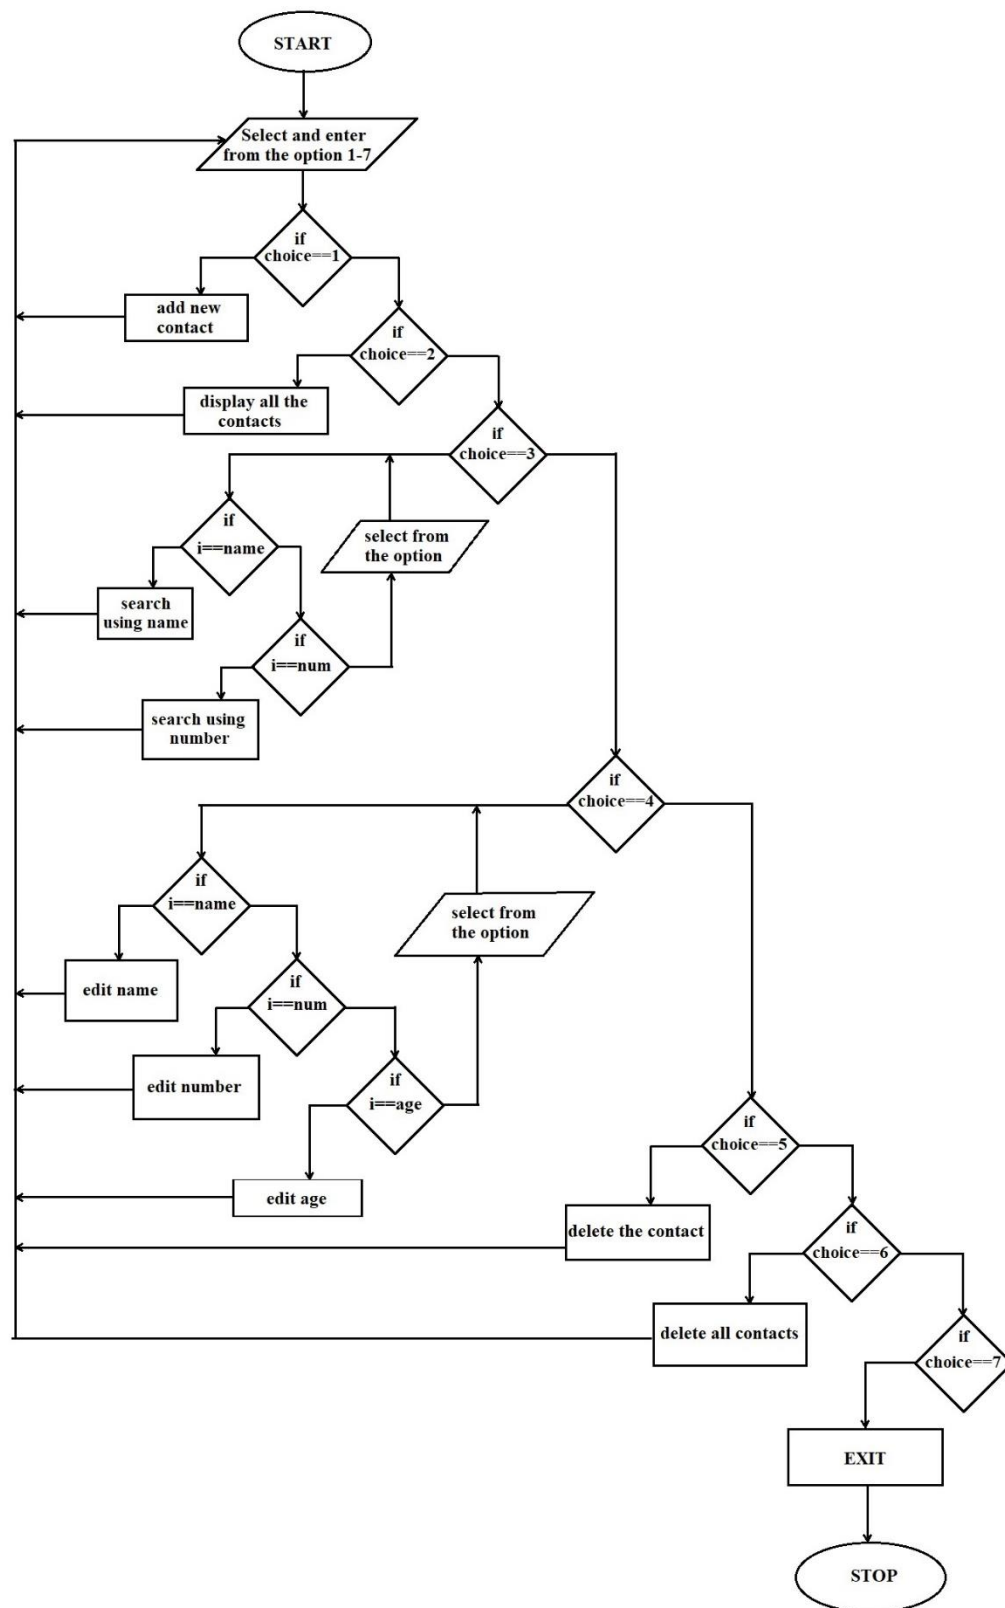

3.1 Functional Design

In many programming language, the main function is where a program starts its execution. It is responsible for the high-level organization of the program's functionality, and typically had access to the command arguments given to the program when it was executed.

The functions in the program are:-

SNO	FUNCTIONS	DESCRIPTIONS
1	MYSQLconnectionCheck()	To check the username and password for MySQL connection.
2	MYSQLconnection()	To establish MySQL connection with python.
3	addcontact()	To enter the contact details in the system.
4	allcontacts()	It displays all the contacts in the alphabetical order.
5	search_number()	To search the details of a contact using phone number.
6	search_name()	To search the details of a contact using name.
7	update_number()	To edit the phone number of a contact.
8	update_name()	To edit the first & last name of a contact.
9	update_age ()	To edit the age of a contact.
10	delete()	To delete a contact from the system.
11	deleteall()	To delete all the contacts.

3.2 System Flow Chart

4. SYSTEM TESTING AND MAINTENANCE

4.1 System Testing

System testing is one of the several processes of the software life cycle and it is considered as the final opportunity to rectify any defects in the software. Testing is the process of testing a program with the main intention of finding the errors. In other words, a process by which one detects the defects in the software. This ensures that the software does not fail. Effective testing helps to reduce the number of errors in the long run. Moreover, testing also ensures that the user needs are satisfied.

Testing demonstrates that the software functions appear to be working according to the customer specifications. There are three ways to test a program:-

- For correctness
- For implementation
- For computational complexity

While testing whenever an error occurs, it was corrected then and there.

There are different methods of testing:-

- Unit testing
- Integration testing
- Validation testing
- Output testing
- Black box testing
- White box testing

4.2 System Maintenance

The definition of software maintenance can be given by describing four activities that are undertaken after the program is released for use.

The first maintenance activity occurs since it is unreasonable to assume that software testing will uncover all errors in a large software system. The process of including the diagnosis and correction of one or more errors is called **corrective maintenance**.

The second activity that contributes to a definition of maintenance occurs since rapid change is encountered in every aspect of computing. Therefore, **adaptive maintenance** modifies software to properly interface with the changing environment.

The third activity involves recommendations for new capabilities, modification to the existing functions and general enhancements when the software is used. To satisfy requests, **perspective maintenance** is performed.

The fourth maintenance activity occurs when the software is changed to improve future reliability or maintainability. This is called **preventive maintenance**.

5. CONCLUSION

Contact management is the process of recording, organizing, tracking and the conservation of information of the clients concerned. The project mentioned above carries out said tasks with basic elementary questions with the appropriate and instructed answers given in the specified format, being accessible and at the disposal of the client(s) or businesses at usage. Consisting of managing features including operations such as adding of single or several contacts to the database providing the faculty of an extensive addition of entries of the clients' discretion, displaying of the entries included in the database specified to the instruction given showing the clients' addition of contacts in listed format for their examination or customization according to their necessities, the facility of the exploration of contacts in the database by searching them individually by providing the respective information of the contact concerned to the specified instruction given, personal customization of the entries by selecting and displaying them individually presented for necessary changes on the clients' discretion and saving them back in the varied form into the database, permanent removal of a specified entry from the database and deletion and exiting from the database with one step. A fairly detailed, easily accessible and effortless contact managing system is undeniably a crucial and necessary accessory in today's sophisticated and identity demanding world where everyone must have an ascertained and known identity for themselves or of any relations they are concerned with, allowing uncomplicated and well understood relations with different individuals or corporations. More benefits of a well thought out contact management system is deeper insight and familiarity with ourselves' and other identities, accurate and productive management of one's identity and credentials, increased efficiency in the organization of the credentials of individuals, client satisfaction achieved through a straightforward system. The Contact management system we programmed achieves mentioned tasks and benefits of a basic and ideal system.
